Subject: Read/Write CDs as possible student storage for Athena?

Hello. You have recieved this message at the request of cec that I let you know what I'm doing this summer, becuae you might be potentially interested in the results, if I am successful.

This summer I will be spending a good deal of time UROPing at the new Art and Media Technology center, with the Architecture Machine Group. I will be designing a unix-compatible file-server/file-system for use with Write-Once Compact Disks.

Some of the unique features of the CDs are that they store an incredible amount of information (on the order of 1GB) and that once a sector on the CD is written, it cannot be altered back to its original state. The file system that I am writing exploits these capiabilites to allow the user to access all previous revisions of his document, access files that have already been deleted, and simple perform simple backup procedures. In the final system, users will get files from their personal CD, modify them, and then the files back to the CD. The directory of the CD will be kept on the CD, in addition to the data. Each user will have his own CD, which will cost less than \$50.

Using a system such as this, it should be possible for a user to save his 100 page thesis to his CD well over a thousand times. If the CD ever fills up, it will be trivial to save the most current version of the document to a virgin CD and start over again. My estimate is that a single CD will last the average MIT student well over his four year stay at the Institute.

I submit that if there was a small write-once CD player next to every Project Athena workstation, this would make the ultimate system for user file storage. It features unlimited user storage, total security, and frees the Athena operations from doing backups on user files. In each cluster there would be two workstations with two CD units, to allow users to do their own backups.

I hope to also write a package which would allow IBM/XTs with ethernet boards to act as CD servers.

I would enjoy discussing the preliminary planning with anybody who is interested. I am very eager to hear feedback.

Subject: Jupiter 7 Plus and phone calls to California

Hi.

I spoke with the Jupiter people. Apparently, there are 6 handshake lines in the Jupiter parallel interface -- it really is designed for DMA, not for "standard" centronix-type parallel I/O. However, Jupiter makes a board which plugs into the Jupiter and gives it a standard centronix parallel port. Then we could just plug the cable from the IBM into the Jupiter, and the data transfer rate would be much higher. The catch is that the board costs \$1500.

I explained the the engineer the kind of problems I've been having and we decided that what might be happening is this: There might be a byte being lost someplace, and the Jupiter is then interpreting the following command arguments as actual commands, (the problem with inband control...) It's given me some ideas where to look, but for now, atleast the setup works from nick.

Fonts will hopefully be working by Tuesday night.

I should have an extensible Lisp-like interpreter to translate from
Amy's code into Magic 6 commands working on the Tuesday after vacation.

If there are problems with this, I can take an IBM disk home with me
and work at it there, as we have 2 PC's at home, and the interpreter does
not depend on the Jupiter or Magic 6 connections.

Eventually, Amy will be able to type simple commands like this:

```
(clear)
(zap)
(rect3 100 200 300 400 5 2)
```

And they will appear on Magic 6 like this

```
call plzt$zap
call plzt$zap
call plzt$rect3 -fb 100 -fb 200 -fb 300 -fb 400 -fb 5 -fb 2
```

I'm leaving town on Saturday but will check my mail sometime during the
week.

Subject: Is 2:00 today ok?

Cc: simsong

I have a class at 2:00, but the teacher is teaching how to program
"General Register Machines." I can skip this class. I'll stop by arcmac
at 2:00 or so. If there's a problem with this time, I'll leave and come
back later, around 5:50. Sorry, but I'm not really free other times today.

If we can't get together today, how about Friday afternoon?
